

Final Deliverables Evaluation Report

IAT 461 Summer 2026

Criterion	Score
Answered Problem Sections	5
Technique judgement	5
Evaluation	5
Communication	5

The notebook was incredibly thorough regarding the steps behind solving each of the three different problems of interest. A clean process was followed with each major question, starting with bar graphs to highlight any uneven category distributions that should be kept in mind when interpreting subsequent results. Comparisons across multiple interconnected columns as a means for solving the three problems were clearly established with a “__ vs __” subheader format, making the data scientist’s thought process easy to follow. Finally, logical conclusions connecting their visualizations to the real world were worded in a way that could help Face The Future Counselling understand trends that can combat student stress (such as the conclusion of how the negative correlation between career clarity and placement stress made sense because knowing more about the state of an industry naturally meant that students would be less stressed to be a part of it).

A big strength of the notebook was in adhering to comparisons with study areas across the entire process, looking at the bigger picture. This shines in their problem summaries, which not only generalize findings but are detailed enough to acknowledge outliers (CS/IT students being the biggest sample size and having different patterns is a notable one) that recontextualize other related findings. For example, through linear regression plots, the data scientist found that AI use had a positive correlation with some stress metrics, but did not necessarily correlate to placement anxiety in general due to observations in much higher daily AI use median for CS/IT students. Visualizations such as boxplots, bar graphs, linear regression, and correlation matrices were appropriate for their supervised learning approach.

Many practical highlights of predictable student trends for FTF to adjust their services for were provided. The solution to the third problem was particularly well-crafted; not only was the specific area of study that had more hardworking yet stressed students identified, they also combined it with the task to find the years of study likely to host that demographic by comparing the percentage of students within CS/IT. They identified specific target students that FTF needed to focus on helping the most, which was a major pillar of FTF’s asks for the data scientist. Presentation-wise, the data scientist did a great job picking specific visualizations out of the wide repertoire they established to cleanly summarize findings and solve the problems, and explaining them in clear, plain English.
